

# INDUSTRIAL VOLTAGE AMPLIFIER IC

## AM401

### PRINCIPLE FUNCTION

**Amplification and conversion of differential signals referenced to ground  
to adjustable industrial voltages (0...V<sub>cc</sub>-5V, e.g. 0...5/10V etc.)  
Variable current/voltage source and integrated protective circuitry**

### TYPICAL APPLICATIONS

- Transducer for sensor applications, for example
- Analog output stage for microprocessors
- Impedance converter
- Voltage regulator with voltage and current sources
- Analog front-end and back-end IC (Frame ASIC concept [1])
- Adjustable output stage IC

# INDUSTRIAL VOLTAGE AMPLIFIER IC AM401

## FEATURES

- Supply voltage range: 6...35V
- Wide operating temperature range: -40°C...+85°C
- Adjustable voltage reference: 5 to 10V
- Additional current/voltage source
- Instrumentation amplifier input CMVI: 1.5...Vcc-3V
- Operational amplifier input Vin: 0...Vcc-5V
- Adjustable gain and offset
- Adjustable output voltage range: 0...Vcc-5V, e.g. 0.5...4.5V, 0...5/10V
- Individually configurable function modules
- Protection against reverse polarity
- Output current limitation
- Short-circuit protection
- Protection against ESD
- RoHS compliant

## GENERAL DESCRIPTION

AM401 and AM401P [2] are universal voltage transmitters designed for differential bridge signal conditioning. The two devices differ in their offset and offset drift values. The ICs are modular and their functional units individually accessible. Both ICs consist of a high-precision instrumentation amplifier for differential input signals and an operational amplifier for input signals referenced to ground. A robust reference voltage source (adjustable between 5 and 10V) can be used to power external components. An operational amplifier stage whose gain is also adjustable acts as an output. The devices also contain an additional operational amplifier which can be used as a current or voltage source. The IC is protected against reverse polarity and has an integrated output current limit. Standard industrial voltages (e.g. 0–5/10V, 0.5–4.5V) can be easily generated using transmitter ICs AM401 and AM401P.

# INDUSTRIAL VOLTAGE AMPLIFIER IC

## AM401

### DETAILED DESCRIPTION OF FUNCTIONS

AM401 is a monolithically integrated voltage transmitter which has been designed for the conditioning of differential bridge voltages and for the conversion of voltage signals referenced to ground. By varying just a few external components the output voltage can be adjusted over a wide range. All of the function blocks are individually accessible, enabling them to be used as functional units or, using the relevant external circuitry, configured as an application-specific device. Typical applications and values for external components are given in the examples described in the following.

In essence AM401 consists of 4 functional blocks as shown in Figure 1. The individual blocks are as follows:

1. The core element of AM401 is its high-precision *instrumentation amplifier* (IA) with an internal gain of  $G_{IA}$  and the ability to set the reference potential of the amplifier externally (pin Z4). The IA acts as an input stage for differential voltage signals.
2. There is also an *operational amplifier stage* (OP1). OP1's gain of  $G_{OP1}$  can be set using external resistors  $R_1$  and  $R_2$  (see Figure 2). The operational amplifier output has been designed in such a way that with certain loads it can be set down to zero. In addition, the output stage can drive up to a maximum of 10mA without an external transistor having to be connected. An output current limit has been implemented as a protective feature which guards the IC at the output in the event of a short-circuit.
3. AM401's *voltage reference* permits voltage to be supplied by external components (such as sensors, microprocessors, etc.). The reference voltage  $V_{REF}$  has a value of either 5V or 10V. External capacitance  $C_1$  acts as a reference voltage stabilizer. It **must** also be connected when the voltage reference is not in use (see: Figure 2).
4. An additional *operational amplifier* (OP2) can be used as a current or voltage source for the supply of external components. OP2's positive input is connected internally to voltage  $V_{BG}$  so that the output current or voltage can be set across a wide range using one or two external resistors. Descriptions of the relevant applications can be found on the following pages. The operational amplifier output has a sufficiently high drive power.

One of AM401's main features is its range of integrated protective circuits which make the IC an effective output stage.

- Pins  $VOUT$ ,  $VCC$  and  $GND$  are protected against reverse polarity across the entire supply voltage range without the need for any additional external components.
- The output of the IC is protected against short-circuiting.
- All pins (with the exception of  $VOUT$ ,  $VCC$  and  $GND$ ) are protected by internal ESD diodes.

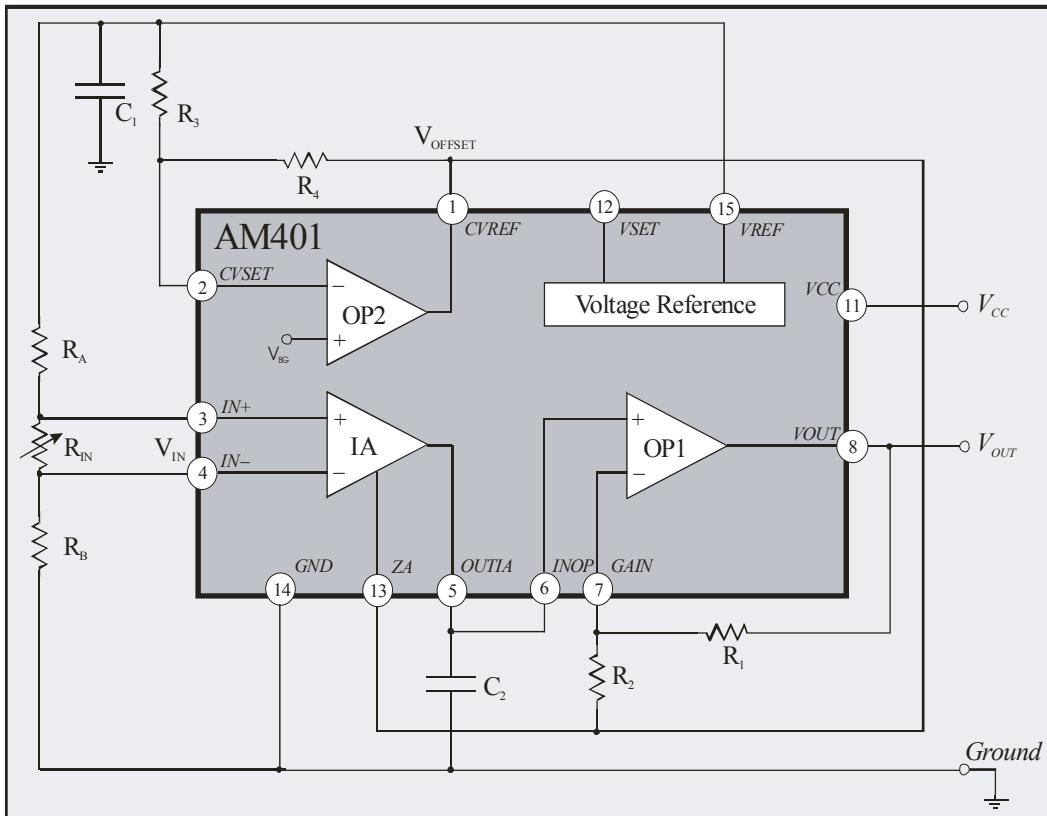

# INDUSTRIAL VOLTAGE AMPLIFIER IC AM401

## AM401's transfer function

In compliance with Figure 2 the transfer function for AM401 when used as an amplifier for differential signals with a voltage output is:

$$V_{OUT} = G_{OP}(G_{IA}V_{IN} + V_{ZA}) \quad (1)$$

where:  $G = G_{IA}G_{OP} = G_{IA}(1 + R_1/R_2)$  (2)

**Figure 2:** The general functions of AM401

## Setting the instrumentation amplifier

The transfer function of the instrumentation amplifier is determined by:

$$V_{OUTIA} = G_{IA}V_{IN} + V_{ZA}$$

with an offset voltage of  $V_{ZA}$  which can be set at pin  $Z_A$ . With the circuitry shown in Figure 2 and using the additional operational amplifier the offset voltage is determined thus:

# INDUSTRIAL VOLTAGE AMPLIFIER IC

## AM401

$$V_{OFFSET} = V_{BG} - \frac{R_4}{R_3} (V_{REF} - V_{BG}) \quad (3)$$

The following applies to the IC's actual output voltage  $V_{OUT}$  (transfer function of OP1):

$$V_{OUT} = G_{OP} \cdot V_{INOP} \quad (4)$$

with an adjustable gain of  $G_{OP}$ :  $G_{OP} = \frac{R_1}{R_2} + 1$  (5)

### Setting the voltage amplification

The gain of operational amplifier stage OP1 can be set using the suitably selected external resistors  $R_1$  and  $R_2$ . If OP1 is connected up as a non-inverting amplifier (see: Figure2) output voltage  $V_{OUT}$  at pin  $V_{OUT}$  is calculated as follows:

$$V_{OUT} = V_{IN} \cdot G_{OP1} \text{ with } G_{OP1} = \frac{R_1}{R_2} + 1$$

where  $V_{IN}$  is the voltage at OP1's input pin  $INOP$ .

### Selecting the supply voltage

In principle AM401 can be used across the entire supply voltage range defined herein. However, depending on the output voltage selected and the circuitry of the remaining components certain boundary conditions apply when selecting  $V_{CC}$ :

- When using voltage output pin  $V_{OUT}$  the IC's minimum supply voltage  $V_{CC}$  necessary for the operation of the device depends on the maximum output voltage  $V_{OUT\max}$  required by the application. The following applies:

$$V_{CC} \geq V_{OUT\max} + 5V \quad (6)$$

- If the additional operational amplifier OP2 is used as a voltage reference or current source, the minimum supply voltage selected ( $V_{CC}$ ) depends on the maximum voltage at pin  $CVREF$ . The following applies:

$$V_{CC} \geq V_{CVREF\max} + 5V \quad (7)$$

When using pin  $V_{OUT}$  and operational amplifier OP2 as a voltage reference or current source the higher value of  $V_{CC}$  must be set.

# INDUSTRIAL VOLTAGE AMPLIFIER IC AM401

## Points to note: initial operation of AM401

1. When operating AM401 it is imperative that external stabilization capacitance  $C_1$  (a high-grade ceramic capacitor) is must always connected. Care must be taken that the value of the capacitance does not lie beyond its given range, even across the range of temperature (see *Boundary Conditions*). The maximum current drawn from the reference must not exceed a value of  $I_{REF} = 10\text{mA}$ .
2. All of the AM401 function blocks not used by the application (e.g. OP2) must be connected up to a defined (and permitted) potential. Unused blocks, such as the additional operational amplifier (see Figure 3), must be configured. The two capacitances  $C_1$  and  $C_2$  must be connected up in any event, even if the reference voltage source is not used.
3. When OP1 is in operation the load resistance at pin  $VOUT$  must be at least  $2\text{k}\Omega$ .

The values of external resistors  $R_1$ ,  $R_2$ ,  $R_3$  and  $R_4$  must be selected so that they lie within the permitted range specified in the boundary conditions on.

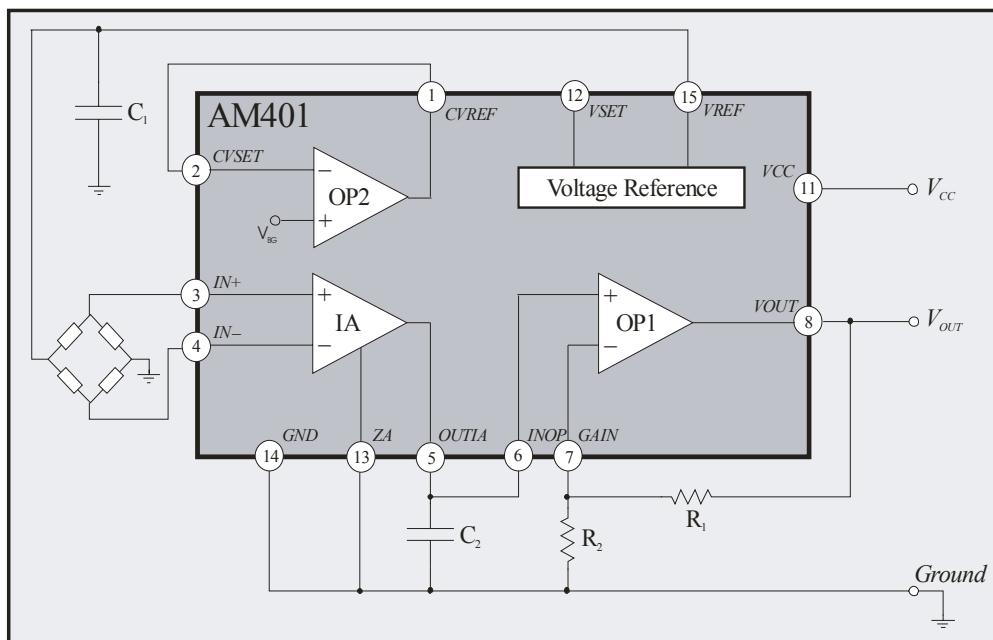

Figure 3: AM401 used as an industrial bridge amplifier

# INDUSTRIAL VOLTAGE AMPLIFIER IC

## AM401

### APPLICATIONS

#### Application 1 – Differential input signal, voltage output signal of 0...5/10V

With applications which require an output voltage of 0...5/10V the pin used to configure the instrumentation amplifier offset ( $Z_A$ ) is connected to the IC's *Ground*. Gain  $G$  is set using the two external resistors  $R_1$  and  $R_2$ :

$$G = G_{IA} G_{OP} = G_{IA} \left(1 + R_1/R_2\right) \quad (2)$$

If no offset voltage is present, the transfer function of the output voltage (Gl.1) is:

$$V_{OUT} = G V_{IN}$$

Using these equations the values of resistors  $R_1$  and  $R_2$  can be set as follows:

$$\frac{R_1}{R_2} = \frac{V_{OUT}}{G_{IA} V_{IN}} - 1$$

**Example 1:** Input voltage (differential) of 0...50mV and output voltage range of 0...10V

If  $V_{IN} = 0 \dots 50\text{mV}$ ,  $R_1/R_2 = 39$  and  $I_{REF} \geq 1\text{mA}$  the values of the external components are as follows:

$$R_1 \approx 117\text{k}\Omega \quad R_2 \approx 3\text{k}\Omega \quad G_{IA} = 5 \quad C_1 = 2.2\mu\text{F} \quad C_2 = 10\text{nF}$$

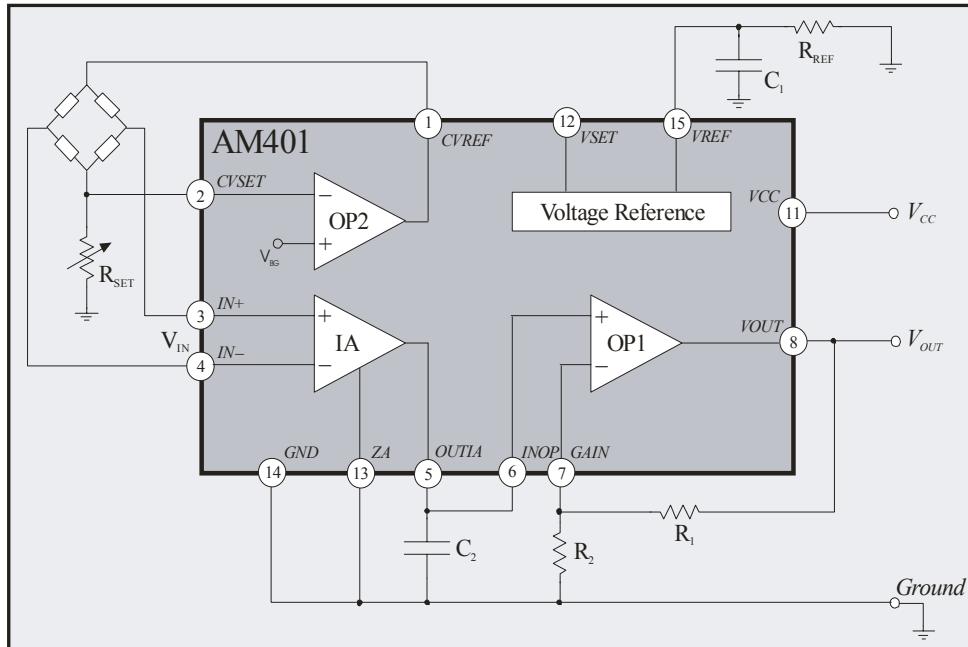

**Example 2:** Input voltage (differential) of 0...100mV and output voltage range of 0...5V

If  $V_{IN} = 0 \dots 100\text{mV}$ ,  $R_1/R_2 = 9$  and  $I_{REF} \geq 1\text{mA}$  the values of the external components are as follows:

$$R_1 \approx 90\text{k}\Omega \quad R_2 \approx 10\text{k}\Omega \quad G_{IA} = 5 \quad C_1 = 2.2\mu\text{F} \quad C_2 = 10\text{nF}$$

# INDUSTRIAL VOLTAGE AMPLIFIER IC AM401

Application 2 – Voltage output signal of 0...5/10V, current-driven sensing element

**Figure 4:** Application for current-driven sensing elements

In this application the additional OP is used as a current source for a resistor measuring bridge. The values of the external components have been calculated for an output voltage of 0...5V; the pin used to configure the instrumentation amplifier offset (*ZA*) is connected to the IC's *Ground*. Gain *G* is set using the two external resistors *R*<sub>1</sub> and *R*<sub>2</sub>:

$$G = G_{IA} G_{OP} = G_{IA} \left(1 + R_1 / R_2\right) \quad (2)$$

If no offset voltage is present, the transfer function of the output voltage (Gl.1) is:

$$V_{OUT} = G V_{IN} \quad (1)$$

Using these equations the values of resistors *R*<sub>1</sub> and *R*<sub>2</sub> can be set as follows:

$$\frac{R_1}{R_2} = \frac{V_{OUT}}{G_{IA} V_{IN}} - 1$$

Supply current *I*<sub>S</sub> for the sensor bridge can be determined using resistance *R*<sub>SET</sub>:

$$I_S = \frac{V_{BG}}{R_{SET}} \quad (8)$$

# INDUSTRIAL VOLTAGE AMPLIFIER IC

## AM401

**Example 3:** Input voltage (differential) of 0...100mV and output voltage range of 0...5V

If  $V_{IN} = 0\ldots100\text{mV}$ ,  $R_1/R_2 = 9$ ,  $I_S = 1.5\text{mA}$   $V_{BG} = 1.27\text{V}$  and  $I_{REF} = 1\text{mA}$  the values of the external components are as follows:

$$\begin{array}{lllll} R_1 \approx 90\text{k}\Omega & R_2 \approx 10\text{k}\Omega & G_{IA} = 5 & C_1 = 2.2\mu\text{F} & C_2 = 10\text{nF} \\ R_{SET} \approx 846.7\Omega & R_{REF} \approx 5\text{k}\Omega & & & \end{array}$$

### Application 3 – Differential input signal, voltage output signal of 0.5...4.5V

With applications which require an output voltage of 0.5...4.5V the pin used to configure the instrumentation amplifier offset (ZA) is connected to voltage  $V_{OFFSET}$  (Figure 5). Gain  $G$  is set using the two external resistors  $R_1$  and  $R_2$ :

$$G = G_{IA} G_{OP} = G_{IA} (1 + R_1/R_2) \quad (2)$$

The transfer function of output voltage  $V_{OUT}$  is:

$$V_{OUT} = G V_{IN} + V_{OFFSET} \quad (1)$$

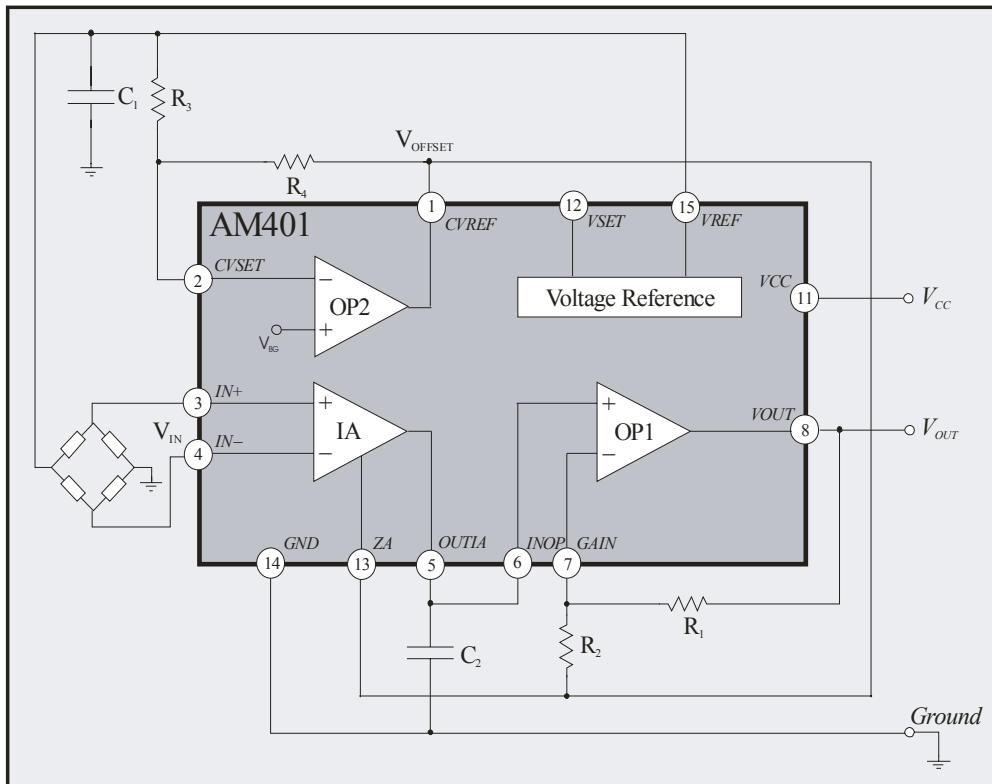

The offset voltage (Equation 3) is calculated as:

$$V_{OFFSET} = V_{BG} - \frac{R_4}{R_3} (V_{REF} - V_{BG}) \Rightarrow \frac{R_3}{R_4} = \frac{V_{REF} - V_{BG}}{V_{BG} - V_{OFFSET}}$$

Using these equations the values of resistors  $R_1$  and  $R_2$  can be set as follows:

$$\frac{R_1}{R_2} = \frac{V_{OUT} - V_{OFFSET}}{G_{IA} V_{IN}} - 1$$

# INDUSTRIAL VOLTAGE AMPLIFIER IC AM401

**Figure 5:** Application as a bridge amplifier for an output voltage of 0.5...4.5V

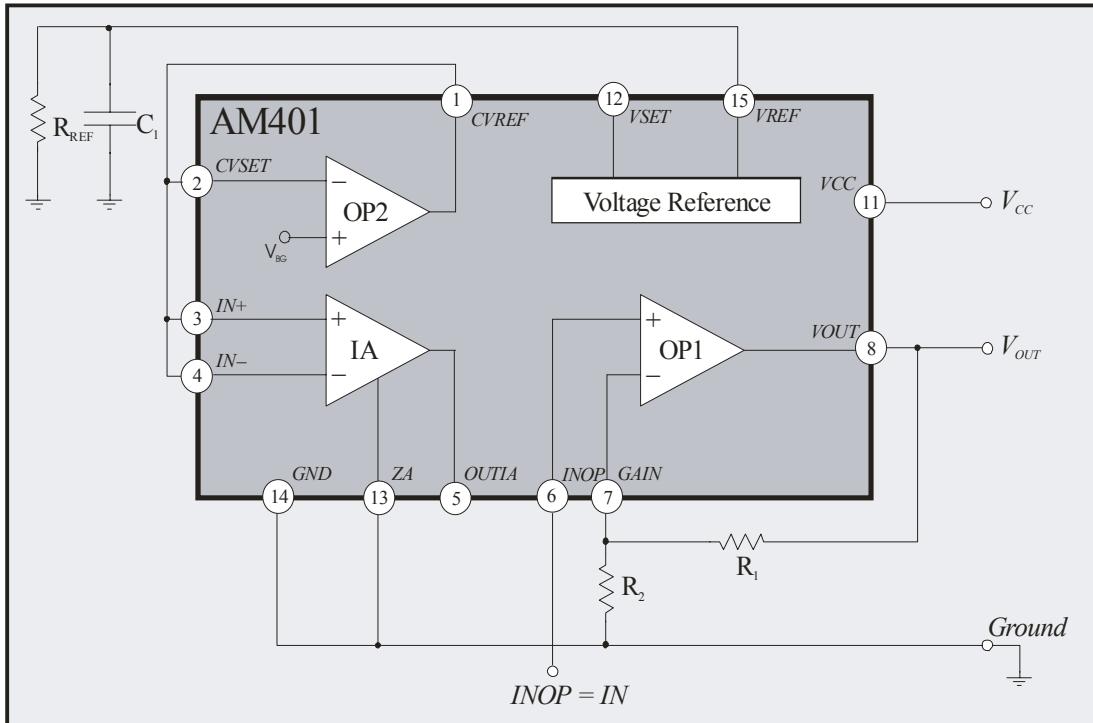

**Example 4:** Input voltage (differential) of 0...250mV and output voltage range of 0.5...4.5V

If  $V_{IN} = 0 \dots 250\text{mV}$ ,  $I_{REF} \geq 1\text{mA}$ ,  $R_1/R_2 = 2.2$  and  $R_3/R_4 = 4.8$  the values of the external components are as follows:

$$\begin{array}{llll} R_1 \approx 100\text{k}\Omega & R_2 \approx 47\text{k}\Omega & R_3 \approx 75\text{k}\Omega & R_4 \approx 15.5\text{k}\Omega \\ V_{OFFSET} = 0.5\text{V} & C_1 = 2.2\mu\text{F} & C_2 = 10\text{nF} & \end{array}$$

# INDUSTRIAL VOLTAGE AMPLIFIER IC AM401

**Application 4 – Input voltage (referenced to ground) of 0...1V and output voltage of 0...10V**

**Figure 6:** AM401 with an OP input stage

For a signal of  $V_{IN} = 0 \dots 1V$  at the OP1 input the external components are to be dimensioned in such a way that there is an output voltage range of  $V_{OUT} = 0 \dots 10V$ . Using the values in Equation 4 the settable gain has a value of:

$$G_{OP1} = \frac{V_{OUT\max}}{V_{IN\max}} = \frac{10V}{1V} = 10$$

where  $V_{IN}$  is the voltage at OP1 input pin  $INOP$ .

According to Equation 5 the below value is calculated for the resistance ratio of the adjustment resistors:

$$\frac{R_1}{R_2} = G_{OP1} - 1 = 9$$

With reference to the boundary conditions for external components given on page 6 the following values are obtained:

$$R_1 \approx 90k\Omega \quad R_2 = 10k\Omega \quad R_{REF} = 5k\Omega \quad C_1 = 2.2\mu F$$

# INDUSTRIAL VOLTAGE AMPLIFIER IC

## AM401

### Application 5 – Connecting up OP2 as a voltage reference

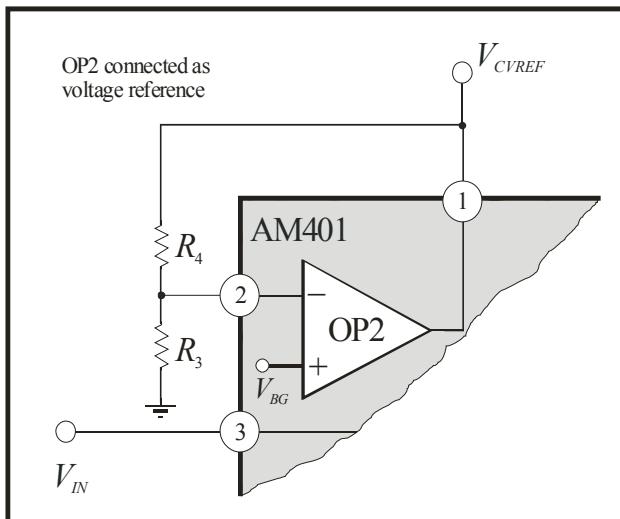

Figure 7: AM401's OP2 as a voltage reference

In addition to the integrated voltage reference of the AM401, the OP2 can also be used as a voltage supply for external components, such as A/D converters or microprocessors, for example. Lower voltages can be generated (e.g. 3.3V) which with the increasing miniaturisation of devices and need for ever lower levels of power dissipation in digital components is today of growing importance. If in addition to the 5/10V reference a further voltage source is required to power external components the second operational amplifier OP2 can be used to this end.

This operational amplifier can be easily configured as a voltage reference. Using the circuit in Figure 7 the following equation is given:

$$V_{CVREF} = V_{BG} \left( 1 + \frac{R_4}{R_3} \right) = 1.27 \text{ V} \left( 1 + \frac{R_4}{R_3} \right) \quad (9)$$

A voltage of  $V_{CVREF} = 3.3\text{V}$  is to be set. With reference to Equation 9 the following ratio is obtained for the external resistors  $R_3$  and  $R_4$ :

$$\frac{R_4}{R_3} = \frac{V_{CVREF}}{V_{BG}} - 1 \approx 2.6 - 1 = 1.6$$

With reference to the boundary conditions for external components given on page 6 the following values are obtained for the resistors:

$$R_3 = 10\text{k}\Omega \quad R_4 = 16\text{k}\Omega$$

## AM401

### BLOCK DIAGRAM AND PINOUT

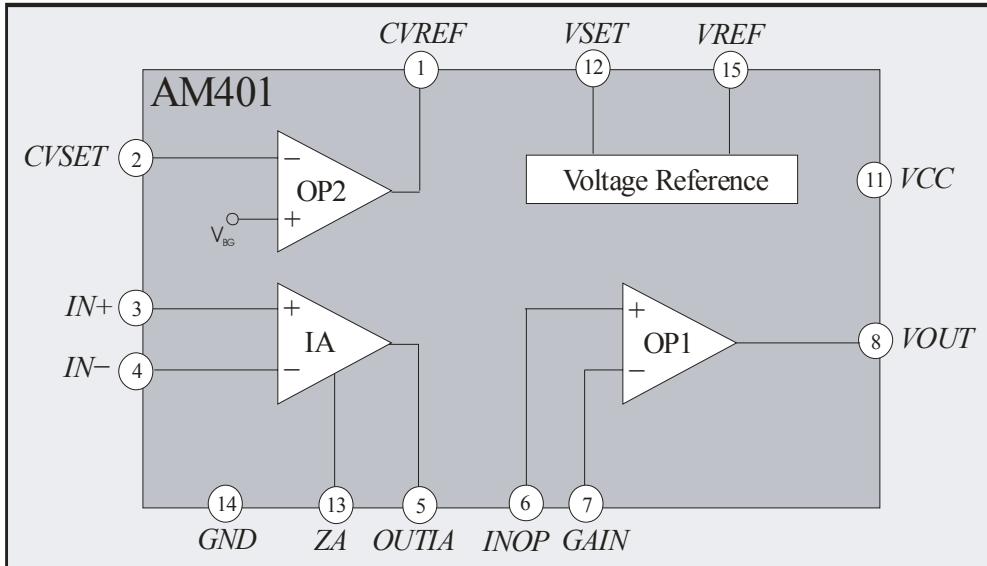

Figure 10: Block diagram of AM401 (individually configurable function modules)

PIN	NAME	DESIGNATION
1	CVREF	Current/Voltage Reference
2	CVSET	Current/Voltage Reference Set
3	IN+	Positive Input
4	IN-	Negative Input
5	OUTIA	Instrumentation Amplifier Output
6	INOP	Operational Amplifier Input
7	GAIN	Gain Adjustment
8	VOUT	Voltage Output
9	N.C.	Not Connected
10	N.C.	Not Connected
11	VCC	Supply Voltage
12	VSET	Voltage Select
13	ZA	Zero Adjustment (Offset)
14	GND	IC Ground
15	VREF	Reference Voltage
16	N.C.	Not Connected

Table 1: Pin out

CVREF	1	16	N.C.
CVSET	2	15	VREF
IN+	3	14	GND
IN-	4	13	ZA
OUTIA	5	12	VSET
INOP	6	11	VCC
GAIN	7	10	N.C.
VOUT	8	9	N.C.

## **AM401**

### **DELIVERY**

AM401 is available as the following packages:

- 16-pin DIL (samples, small series)
- SO 16 (n): please see our website (data sheets: package.pdf)
- SSOP 16: please see our website (data sheets: package.pdf)
- Dice on 5" blue foil (on request)

### **PACKAGE DIMENSIONS**

Please see our website (data sheets: package.pdf).

### **FURTHER READING**

- [1] The Frame ASIC concept: <http://www.Frame-ASIC.de/>
- [2] The Analog Microelectronics GmbH website: <http://www.analogmicro.de/>
- [3] Available also for the AM401: Application notes AN1013 on the Analog Microelectronics website: <http://www.analogmicro.de/>

Analog Microelectronics reserves the right to make amendments to any dimensions, technical data or other information contained herein without further notice.
